

Option 1:

Contour Flange with Compensation Plate – Angled Pedestal

This arrangement is mainly seen on the smaller size agitator range and is the simplest setup. The arrangement involves welding of a compensation plate to the outside of the tank. This compensation plate is designed to provide additional support to the tank at the point where the agitator is mounted. The compensation pad is designed to fit the contour of the tank.

The location of the agitator in the tank should be as per the following drawings.
